

Calculus (Differentiation & Integration)

Differentiation - Differential calculus is used to study the nature (increase or decrease) and the amount of variation in a quantity when another quantity (on which first quantity depends) changes independently.

$\frac{dy}{dx}$ (y first the change is related with respect to x)

is the instantaneous rate of change of function y with respect to variable x.

Q The radius of circle is increasing at the rate of 0.7 cm per second. What is the rate of increase in its circumference.

$$\cancel{\frac{dr}{dt}} \quad \frac{dr}{dt} = 0.7 \text{ cm/s}$$

$$C = 2\pi r$$

$$\frac{dc}{dt} = 2\pi \frac{dr}{dt}$$

$$= 2 \times 0.7 \times \pi$$

$$= 1.4\pi \text{ m/s}$$

Q2. The side of square is increasing at the rate of 0.2 cm/s
find rate of increase in its perimeter.

$$s = 4s$$

$$\frac{ds}{dt} = 0.2 \text{ cm/s}$$

$$\frac{dp}{dt} = 4 \times \frac{ds}{dt}$$

$$\boxed{= 0.8 \text{ cm/s}}$$

Q③. The radius of a spherical balloon is decreasing at the rate of 10 cm/s. At what rate is the surface area of the balloon decreasing when its radius is 15 cm.

$$\frac{dr}{dt} = -10 \text{ cm/s}$$

$$\text{area} = 4\pi r^2$$

$$\begin{aligned}\frac{da}{dt} &= 4\pi (-10)^2 \\ &= 4\pi \cancel{-100} \\ &= -400\pi \text{ cm}^2/\text{s}\end{aligned}$$

$$\begin{aligned}\frac{dA}{dt} &= \frac{d}{dt} (4\pi r^2) \\ &= 4\pi \cancel{r^2} \times \cancel{\frac{d}{dt}} \left(\frac{dr}{dt} \right) \\ &= 4\pi \cancel{r^2} \times -10\end{aligned}$$

$$= -80\pi r$$

$$r = 15 \text{ (given)}$$

$$\begin{aligned}&= -80\pi \times 15 \text{ cm}^2/\text{s} \\ &= -1200\pi \text{ cm}^2/\text{s}\end{aligned}$$

Q4. An Edge of a variable cube of ~~area~~ is increasing at a rate of 3 cm/s. How fast is its volume increasing when the edge is 10 cm long.

$$\frac{de}{dt} = 3 \text{ cm/s}$$

$$V = e^3$$

$$\frac{dV}{dt} = \frac{d}{dt}(e^3) = 3e^2 \times 3$$

$$\therefore e = 10$$

$$= 3(10)^2 \times 3$$

$$= 9 \times 100$$

$$= 900 \text{ cm}^3/\text{s}$$

Q5. The volume of a spherical balloon is increasing at the rate of 25 cm³/s. Find the rate of change of its surface area at the instant when its radius is 5 cm.

$$V = \frac{4}{3}\pi r^3$$

$$\frac{dV}{dt} = 25$$

$$25 = \frac{4}{3}\pi \times 3r^2 \times \frac{dr}{dt}$$

$$\frac{25 \times 3}{4 \times 12 \times 3 \times 8 \times 9}$$

$$\frac{1}{4\pi} = \frac{dr}{dt}$$

$$\left. \begin{aligned} dA &= 4\pi r^2 \\ \frac{dA}{dt} &= 4\pi(2r) \times \frac{dr}{dt} \\ &= 4\pi \times 2 \times 5 \times \frac{1}{4\pi} \\ &= 10 \end{aligned} \right\} \text{cm}^2/\text{s}$$

Kinematics (Motion in one Dimension)

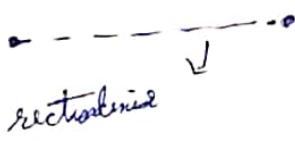

Kinematics - The branch of theoretical mechanics which deals with study of motion of rigid bodies without taking into account (shape cannot be changed).

The cause of motion (i.e. forces acting on them) is called Kinematics.

Point object - A particle in its strict sense means an object without dimensions (no size, only a point)

Translatory motion - when there is no change in the orientation of a object while moving. (Every point travels same distance)

rectilinear
(straight line)

rectilinear

curvilinear
~~rotatory~~
(curved path)

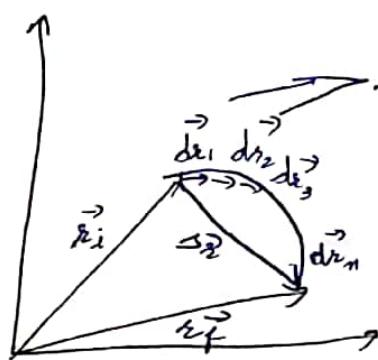

curvilinear

* Position of a particle in space is determined relative to some fixed point, position depends on position of observer.
↳ reference points.

* The path followed by a point object during its motion is called its trajectory.

Distance & Displacement

* Distance is the length of the path actually traversed while displacement is the change in position vector.

Displacement ; $\Delta \vec{r} = \vec{r}_f - \vec{r}_i$

$$\Delta \vec{r} = \int dr$$

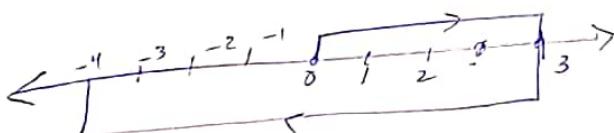

adding all elementary vectors

$$\text{Distance} = \int |dr|$$

adding of all magnitudes of elementary vectors.

- Distance is multi-valued function while displacement is a single valued function.
- Distance \geq Displacement \rightarrow can be +ve, -ve or zero
- Distance \geq Displacement \rightarrow always Positive

e.g.

$$\text{Distance} = 3 + 3 + 4 = 10$$

$$\text{Displacement} = x_f - x_i = 3 - (-1) = 4$$

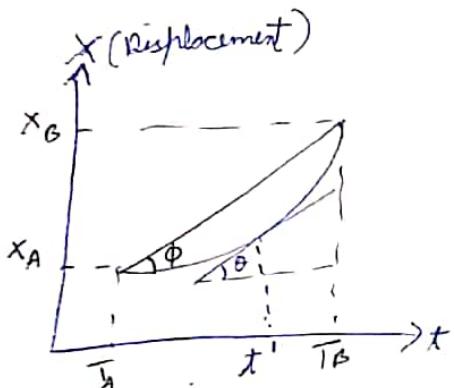

Speed & Velocity -

Average Speed - $\frac{\text{Total Distance}}{\text{Total Time}}$

$$\underline{\text{Average Velocity}} = \frac{\text{Displacement}}{\text{Time}} = \frac{\Delta \vec{x}}{\Delta t}$$

Instantaneous velocity - ~~velocity~~ Rate of change of position at given time instance.

$$\boxed{\text{Velocity} = \frac{dx}{dt}}$$

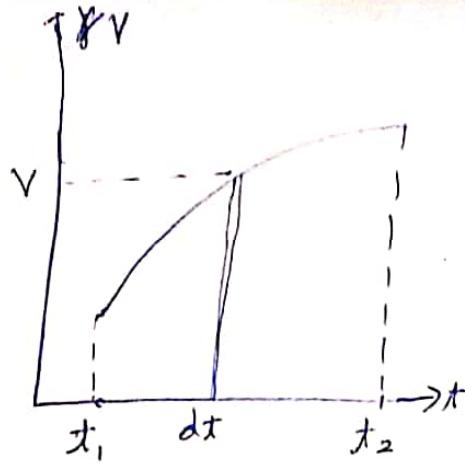

instantaneous velocity at t_1 ~~is~~ slope

$$\boxed{v = \frac{dx}{dt} = \tan \theta}$$

Average velocity = slope of chord

$$\text{Average velocity} = \boxed{\frac{x_B - x_A}{t_B - t_A} = \tan \phi}$$

Note:- ① Slope of Displacement-time graph gives velocity.

$$v = \frac{dx}{dt}$$

② Area under v-t graph with proper sign gives displacement & without sign gives distance

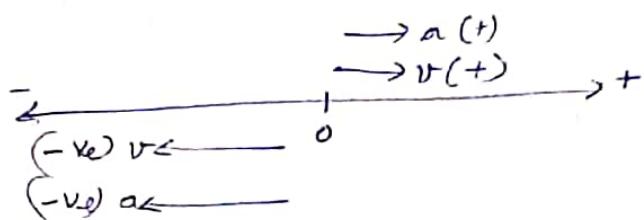

$$x = \int v dt$$

*Acceleration:-

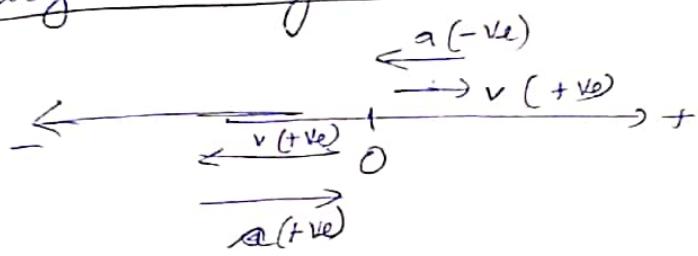

* Slope of v-t graph gives acceleration.

→ Body is speeding up

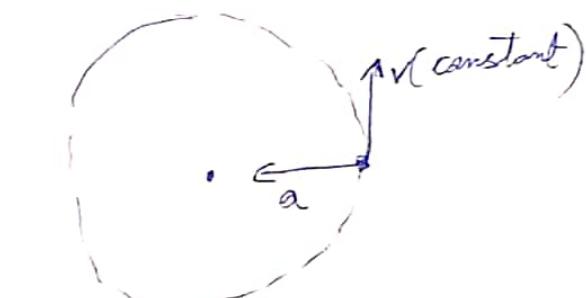

When velocity & acceleration are of same sign. (either both be +ve or -ve), speed of body will increase.

→ Body is slowing down (Retardation / deceleration)

When \vec{v} & \vec{a} are in opp sign. i.e., speed of body decreases.

→ Velocity \perp Acceleration.
